Web Applications

The recent initiation of China-Pakistan Economic Corridor (CPEC) has made it imperative for the Government of Gilgit-Baltistan (GB) to streamline and increase efficiency in issuing Border Pass to the people of GB who visit the adjoining province of China. Currently, the Border Pass is just a paper document and all records are kept in official files. The growing population travelling from GB to China adds burden for existing paraphernalia available for border pass. The problem was completely solved by designing and developing a web based solution successfully.

In Gilgit- Baltistan there is no proper check and balance related to issuance of certificates which mainly include Domicile, Death Certificate, Land Mutation, Birth Certificate e.t.c. There is a dire need to properly monetarize the overall system with proper facts and figures. Moreover, the response of public is quite necessary when an individual receives the certificate.

Web Applications

QENEQTION is a platform that will provide you the connections to resources, talent and initiatives you are looking for. Your continuous connection, patronage and encouragement will enable to attain a collective national dream. We look forward to the technology community for strengthening this platform. It is for you, built by people belonging to your community.

QENEQTION is open to all technologies and want all technology stakeholders, public and private sector, movers and shakers, ordinary and extraordinary, innovators and consumers, contributors and disruptors, leaders and followers, experienced and fresh-minds, to be a part of this platform.

EHR Mobile & Web Apps

Most of the tasks performed by the doctors are manual, while checking their patients. There is no proper record of patient information, appointments, diseases, injuries, visitation log etc. Even most of the hospitals lack such systems. There is a dire need of such a system whether the doctors are in hospital or in their personal clinic. So this problem was completely solved by designing and developing a complete web based system with mobility features.

A same version was designed and developed for the mobile app. All the minor and major functionalities were implemented successfully.
